

PROJECT PROPOSAL & DOCUMENTATION

SIR-KAY TRANSPORTATION KPI PERFORMANCE DASHBOARD

A Business Intelligence & Analytics Dashboard for Fleet, Revenue and Operational Performance Tracking

Prepared for: Sir-Kay Transportation & Logistics

Prepared by: Wahab Sodiqlamide

Date: August 2026

Tools: Microsoft Excel (Pivot Tables, Power Query, DAX-style formulas, VBA)

1. Executive Summary

Sir-Kay Transportation operates a multi-branch bus fleet across several routes nationwide. This project delivers a fully interactive Excel-based Key Performance Indicator (KPI) dashboard that gives management real-time visibility into revenue, fleet utilization, driver performance, and service reliability without needing to touch raw data or write a single formula.

The final dashboard exceeds the original scope: it includes 10 KPI cards with live month-over-month trend indicators, 7 interactive charts, 6 cross-filtering slicers, and a dynamic report title that updates automatically to describe whatever filter combination is currently active. The result is a self-service analytics tool built entirely on native Excel capability no external BI software required.

2. Project Goal

To give management a clear, at-a-glance understanding of how efficiently the transportation business is operating, and to surface exactly where performance can be improved by branch, route, vehicle, driver, and time period.

3. Business Scenario

Sir-Kay Transportation runs daily bus operations across multiple branches and routes. Management needed a single source of truth to answer:

- Which routes generate the most revenue?
- Who are the best performing drivers?
- Which vehicles are underutilized?
- Which routes experience the most delay?
- How much fuel is being consumed, and at what cost?
- What is the occupancy rate across the fleet?
- Which branches are the most profitable?

4. Stakeholders & Reporting Needs

4.1 Operations Manager

- Trips completed and delayed
- Active vehicle utilization
- Fuel usage trends

4.2 Finance Manager

- Revenue and operating cost
- Net profit and profit margin
- Month-over-month financial trends

4.3 Branch Manager

- Driver performance rankings
- Route performance rankings
- Passenger volume by branch

5. Dashboard Filters (Slicers)

The dashboard supports six fully cross-connected filters, each synchronized across every KPI card, chart, and calculation in the workbook:

- Year
- Month
- Branch
- Route
- Vehicle Type
- Driver Name

Selecting any combination instantly recalculates all 10 KPI cards, all 7 charts, and the report title with a cascade rule so that clearing the Year filter automatically resets every other filter back to its default “all data” state.

6. Key Performance Indicators

The dashboard presents 10 KPI cards, each with a live month-over-month (MoM) trend indicator showing percentage change and directional arrow versus the prior month:

KPI	Description
Total Revenue	Total ticket revenue for the selected period, with MoM trend
Net Profit	Revenue less fuel and operating cost, with MoM trend
Total Trips	Count of completed trips, with MoM trend
Total Passengers	Total passengers transported
Profit Margin	Net profit as a percentage of revenue, with MoM trend
On-Time Rate	Percentage of trips completed without delay
Fuel Cost	Total fuel expenditure, with MoM trend
Best Route	Highest revenue-generating route for the current filter
Best Branch	Highest revenue-generating branch for the current filter
Best Driver	Highest revenue-generating driver for the current filter

7. Data Visualizations

Seven charts support deeper analysis beneath the KPI summary layer:

- Monthly Revenue Trend — line chart of revenue across the full reporting period
- Monthly Occupancy Trend — line chart of average vehicle occupancy over time
- Revenue by Branch — horizontal bar chart ranking branch performance
- Average Vehicle Occupancy — column chart broken out by vehicle type
- Top 10 Revenue Route — horizontal bar chart, rebuilt on a resilient formula engine so it always shows exactly 10 routes regardless of filter combination
- Top 10 Drivers by Revenue — horizontal bar chart, same resilient formula approach
- Trip Punctuality Distribution — donut chart breaking trips into On Time, Minor, Moderate, and Major delay categories

8. Data Model

The dashboard is powered by a single structured trip-level table (tblTrips), ensuring every pivot table and slicer shares one consistent source and cache. Key fields include:

- Date, Branch, Route, Vehicle ID, Vehicle Type, Driver Name, Trip ID
- Departure Time, Arrival Time, Delay (minutes)
- Distance (km), Fuel Cost, Operating Cost, Ticket Revenue
- Passenger Count, Vehicle Capacity, Occupancy Rate

9. Advanced Technical Features

Beyond the original scope, the final build incorporates several advanced Excel and VBA capabilities that give the dashboard production-grade reliability:

- Dynamic Report Title — a VBA-driven title that reads all 6 slicer selections in real time and rewrites the dashboard header to describe the exact filter context, e.g. “2025 | March | Lagos Branch.”
- Month-over-Month Trend Engine — a dedicated calculation layer computing live percentage change and directional indicators for Revenue, Net Profit, Fuel Cost, Total Trips, and Profit Margin.
- Cascade Filtering — clearing the Year filter automatically resets all other filters, keeping the dashboard’s filter state logically consistent at all times.
- Resilient Ranking Tables — Top 10 Route and Top 10 Driver visuals were rebuilt on LARGE/INDEX/MATCH formula logic rather than native pivot ranking, so they hold up reliably under every filter combination, including edge cases with sparse data.

10. Development Methodology

Phase 1 — Discovery

- Business understanding and stakeholder requirements
- Dataset review and KPI definition

Phase 2 — Data Preparation

- Data cleaning and structuring
- Master and helper table construction

Phase 3 — Calculation Layer

- Evaluation sheet and core calculations
- Pivot table architecture and shared data source

Phase 4 — Dashboard Design

- KPI card layout and visual hierarchy
- Brand-consistent color coding across categories

Phase 5 — Interactivity & Insight

- Chart build-out and cross-filtering
- Dynamic title, MoM trend engine, and cascade logic
- Executive-level insight validation

11. Key Business Insights Delivered

- Identification of the best performing route by revenue
- Identification of the highest revenue-generating driver
- Visibility into occupancy performance by vehicle type
- Branch-level profitability ranking
- Month-over-month visibility into revenue, cost, and profit trends
- Trip punctuality breakdown to support service reliability decisions

12. Conclusion

This dashboard delivers a comprehensive, self-service performance reporting tool for Sir-Kay Transportation, built entirely within Microsoft Excel. It equips Operations, Finance, and Branch Managers with the real-time, filterable insight needed to make faster, more confident decisions from fleet utilization to route profitability to driver performance without dependency on external software or manual reporting.
